

Melanoma Detection Using Custom CNN

Problem statement: To build a CNN based model which can accurately detect melanoma. Melanoma is a type of cancer that can be deadly if not detected early. It accounts for 75% of skin cancer deaths. A solution that can evaluate images and alert dermatologists about the presence of melanoma has the potential to reduce a lot of manual effort needed in diagnosis.

1. Data Understanding and Reading

We start by defining paths for training and testing datasets and understanding the structure of the data.

Importing all the important libraries

```
In [82]: import pathlib
        import tensorflow as tf
import matplotlib.pyplot as plt
import numpy as np
import pandas as pd
import os
import PIL
from PIL import Image
from tensorflow import keras
from tensorflow.keras import layers
from tensorflow.keras.models import Sequential
```

```
In [39]: from glob import glob
```

```
In [40]: from google.colab import drive
drive.mount('/content/gdrive')
##Ref:https://towardsdatascience.com/downloading-datasets-into-google-drive-via-google-colab-bc
```

Drive already mounted at /content/gdrive; to attempt to forcibly remount, call
drive.mount("/content/gdrive", force_remount=True).

This assignment uses a dataset of about 2357 images of skin cancer types. The dataset contains 9 sub-directories in each train and test subdirectories. The 9 sub-directories contains the images of 9 skin cancer types respectively.

```
In [41]: # Defining the path for train and test images
```

```
data_dir_train = pathlib.Path("/content/gdrive/MyDrive/EPGP in ML and AI @ IIITB/20. DEEP LEARN")
data_dir_test = pathlib.Path("/content/gdrive/MyDrive/EPGP in ML and AI @ IIITB/20. DEEP LEARN")
```

```
In [42]: # Calculating the number of .jpg image files within Root directory and its subdirectories

image_count_train = len(list(data_dir_train.glob('*//*.jpg')))
print(image_count_train)
image_count_test = len(list(data_dir_test.glob('*//*.jpg')))
print(image_count_test)
```

2239
118

Load using keras.preprocessing

Let's load these images off disk using the helpful
image_dataset_from_directory utility.

2. Dataset Preparation

Define some parameters for the loader:

```
In [43]: batch_size = 32
        img_height = 180
img_width = 180
```

Use 80% of the images for training, and 20% for validation.

```
In [44]: train_ds = tf.keras.utils.image_dataset_from_directory(# tf.keras.utils.image_dataset_from_directory(
    data_dir_train, # to read images from the specified directory and its subdirectories
    batch_size=batch_size, # to create batches of images and their corresponding labels
    image_size=(img_height, img_width), # to resize the images to the specified image size
    seed=123, # to shuffle the data to ensure that the model is exposed to diverse samples
    validation_split=0.2, # to split the data into training and validation sets based on the subset
    subset='training',
)
```

Found 6739 files belonging to 9 classes.
Using 5392 files for training.

```
In [45]: val_ds = tf.keras.utils.image_dataset_from_directory(
    data_dir_train,
    batch_size=batch_size,
    image_size=(img_height, img_width),
    seed=123,
    validation_split=0.2,
    subset='validation',
)
```

Found 6739 files belonging to 9 classes.
Using 1347 files for validation.

```
In [46]: # Listing out all the classes of skin cancer and store them in a list.
        # We can find the class names in the class_names attribute on these datasets.
        # These correspond to the directory names in alphabetical order.
class_names = train_ds.class_names
print(class_names)
```

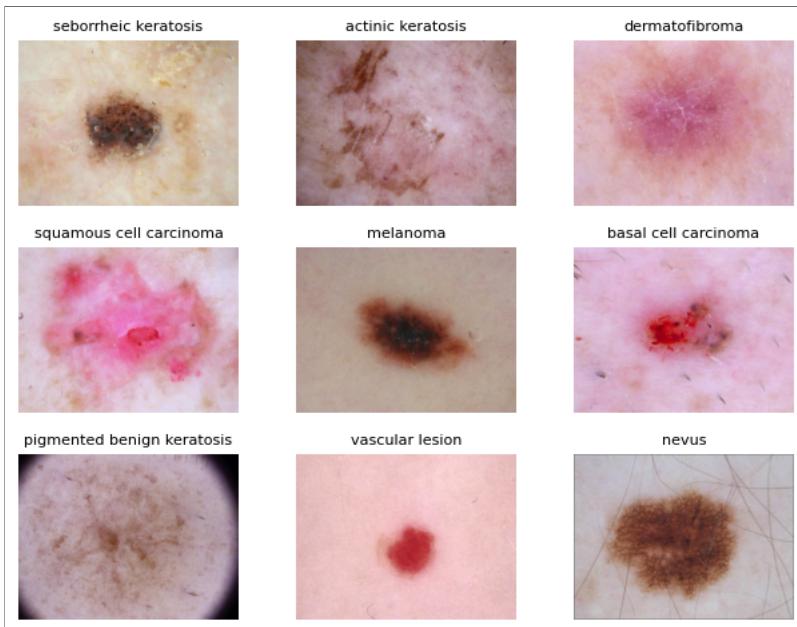

```
[actinic keratosis', 'basal cell carcinoma', 'dermatofibroma', 'melanoma', 'n
evus', 'pigmented benign keratosis', 'seborrheic keratosis', 'squamous cell ca
rcinoma', 'vascular lesion']
```

3. Data Visualization

Let's visualize one instance of all the nine classes present in the dataset.

```
In [47]: counter = 1
    for c in data_dir_train.iterdir():
        # Make sure the directory is not empty and contains files
        files = list(c.iterdir())
        if files: # Check if the list is not empty
            im = Image.open(files[0]) # Open the first image in the directory
            plt.subplot(3, 3, counter)
            plt.imshow(im)
            plt.title(str(c).split('/')[-1], fontsize=8) # Set font size to avoid overlap
            counter += 1
            plt.axis("off")

# Adjust the Layout to avoid title overlap
plt.tight_layout()
plt.show()
```

The `image_batch` is a tensor of the shape `(32, 180, 180, 3)`. This is a batch of 32 images of shape `180x180x3` (the last dimension refers to color channels RGB). The `label_batch` is a tensor of the shape `(32,)`, these are corresponding labels to the 32 images.

`Dataset.cache()` keeps the images in memory after they're loaded off disk during the first epoch.

`Dataset.prefetch()` overlaps data preprocessing and model execution while training. This prefetches a certain number of batches of training data from the pipeline in advance and stores them in a buffer. This helps

overlap data processing with model training, potentially improving training speed.

```
In [48]: AUTOTUNE = tf.data.experimental.AUTOTUNE # Tells TensorFlow to analyze the hardware and
         train_ds = train_ds.cache().shuffle(1000).prefetch(buffer_size=AUTOTUNE)
         val_ds = val_ds.cache().prefetch(buffer_size=AUTOTUNE)
```

4. Custom CNN Model Building

We design a CNN model for accurate multi-class classification.

```
In [49]: num_class = 9 # sets the number of output classes for the classification problem to 9
         model = tf.keras.Sequential([
             # This creates a sequential model in TensorFlow/Keras.
             layers.Rescaling(scale = 1./255, input_shape = (180,180,3)), # Normalizes pixel values
             layers.Conv2D(16,3,padding='same',activation='relu'), # This is the first convolutional layer
             layers.MaxPooling2D(pool_size = 2, strides = 2), # These layers downsample the feature map
             layers.Conv2D(32,3,padding='same',activation='relu'),
             layers.MaxPooling2D(pool_size = 2, strides = 2),
             layers.Conv2D(64,3,padding='same',activation='relu'),
             layers.MaxPooling2D(pool_size = 2, strides = 2),
             layers.Flatten(), # This layer converts the 2D feature maps from the previous convolutional layers
             layers.Dense(128,activation='relu'), # This is the first fully connected (dense) layer. It has 128 neurons.
             layers.Dense(num_class) # This is the output layer. It has 9 neurons, one for each class.
         ])
```

Compiling Model-1:-

Choose an appropriate optimiser and loss function for model training

```
In [50]: ### Now we choose adam optimiser and loss function
         ### Loss Function: Sparse Categorical Crossentropy Calculates the crossentropy loss between the predicted probability distribution and the true distribution.
model.compile(optimizer='adam',
              loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits = True),
              metrics=['accuracy'])
```

```
In [51]: # View the summary of all Layers
model.summary()
```

Visualizing the results after training Model-1:-

```

In [54]: acc = history.history['accuracy'] # This line retrieves the training accuracy values for each epoch
val_acc = history.history['val_accuracy']

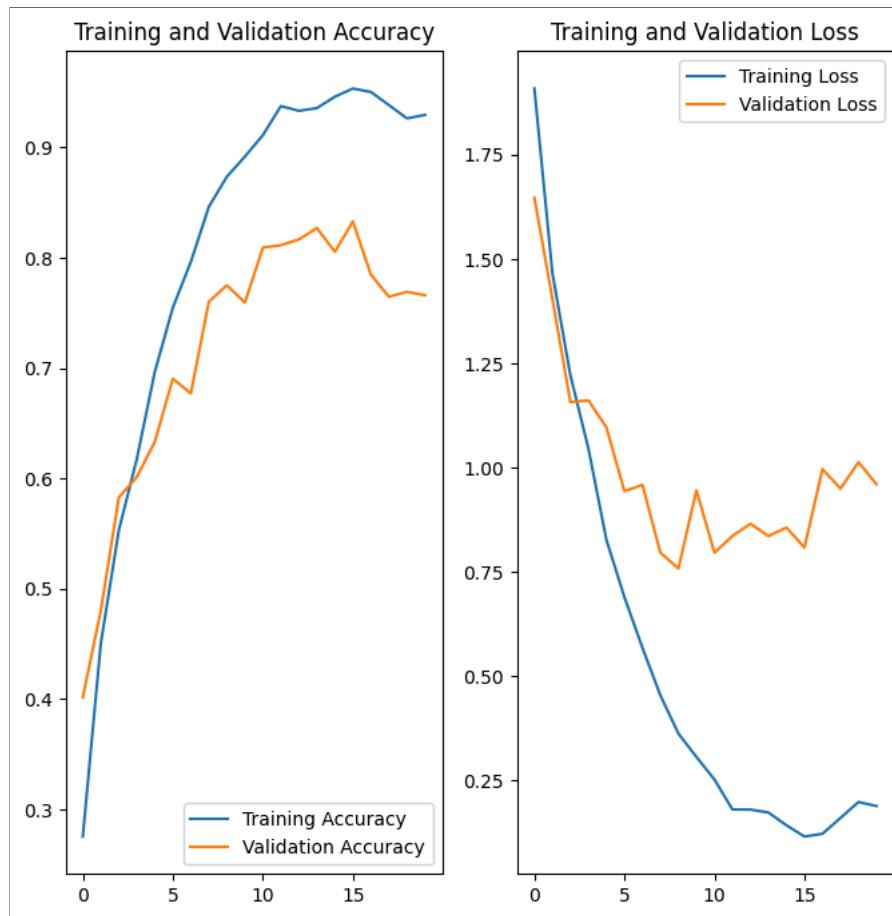

loss = history.history['loss']
val_loss = history.history['val_loss']

epochs_range = range(epochs) # This creates a list representing the range of epochs (0 to epoch)

plt.figure(figsize=(8, 8)) # This line creates a new figure window with a size of 8x8 inches
plt.subplot(1, 2, 1) # This divides the figure window into a 1x2 grid of subplots. It creates the first subplot.
plt.plot(epochs_range, acc, label='Training Accuracy') # This plots the training accuracy value
plt.plot(epochs_range, val_acc, label='Validation Accuracy') # This plots the validation accuracy value
plt.legend(loc='lower right') # This adds a legend to the first subplot, positioning it in the lower right corner
plt.title('Training and Validation Accuracy') # This sets the title for the first subplot.

plt.subplot(1, 2, 2)
plt.plot(epochs_range, loss, label='Training Loss')
plt.plot(epochs_range, val_loss, label='Validation Loss')
plt.legend(loc='upper right')
plt.title('Training and Validation Loss')
plt.show()

```

5. Findings and Data Augmentation

Accuracy:

Training Accuracy: The training accuracy steadily increases from the initial epochs, indicating that the model is learning from the training data.

Validation Accuracy: The validation accuracy increases initially but then plateaus and starts to decline after around Epoch 10. This suggests that the model is overfitting to the training data.

Loss:

Training Loss: The training loss decreases consistently throughout the training process, as expected.

Validation Loss: The validation loss decreases initially but then starts to increase significantly after around Epoch 10. This confirms the overfitting behavior observed in the accuracy plot.

Recommendations for Improvement:

Early Stopping: We implement early stopping to avoid overfitting. This would halt training once the validation loss stops improving.

Data Augmentation: We use data augmentation to artificially increase the size of the training dataset. This improves generalization. We use more data augmentation to make the model more robust to different variations in input images.

Example transformations: rotation, flipping, zooming, and cropping.

```
In [55]: # After we have analysed the model fit history for presence of underfit or overfit, we
data_augmentation = tf.keras.Sequential([
    layers.experimental.preprocessing.RandomFlip("horizontal_and_vertical"), # This helps the model
    layers.experimental.preprocessing.RandomRotation(0.2), # This exposes the model to variations
    layers.experimental.preprocessing.RandomZoom(height_factor=(0.2,0.3), width_factor=(0.2,0.3))
    # This augmentation helps the model learn to recognize objects at different scales and improves
])
```

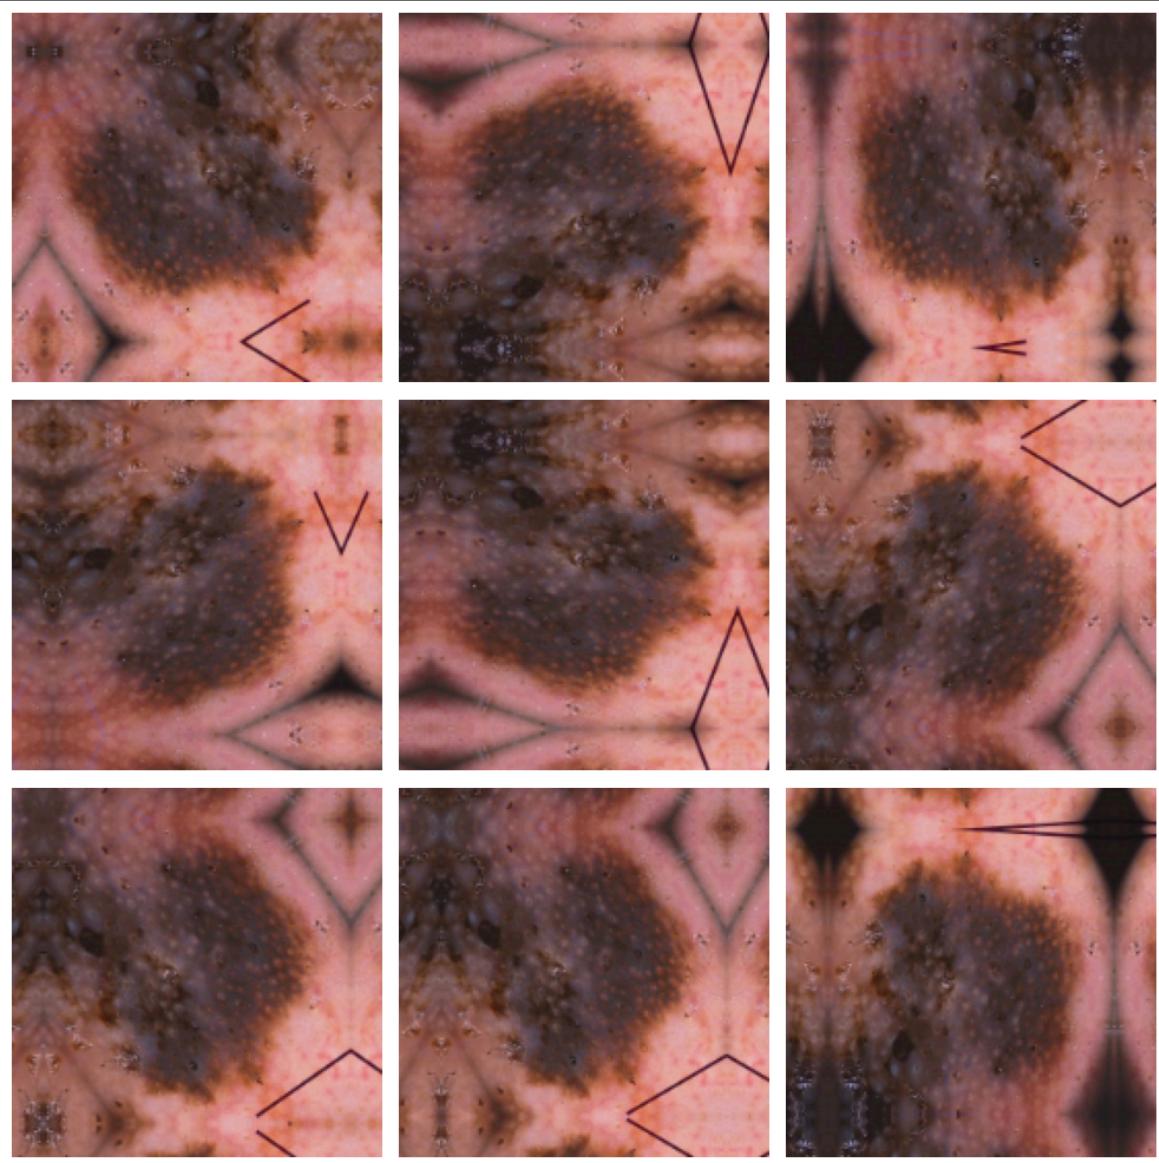

```
In [56]: # Visualizing how your augmentation strategy works for one instance of training image.
```

```
for batch, labels in train_ds.take(1): # This loop iterates only once over the train_ds dataset
    im = batch[0] # This extracts the first image from the current batch
    im = tf.reshape(im, (1, img_width, img_height, 3)) # This reshapes the image (im) into a float32 tensor
    # The new shape is (1, img_width, img_height, 3)

plt.figure(figsize=(10, 10))
for i in range(9): # This loop iterates 9 times, applying the data augmentation to the original
    augmented_image = data_augmentation(im)[0] # This applies the data augmentation sequence (as defined above)
    # The [0] indexing extracts the augmented image from the output.
    img_to_show = augmented_image.numpy() # This converts the augmented image from a TensorFlow tensor
    img_to_show = img_to_show.astype("uint8") # This converts the data type of the image array

    ax = plt.subplot(3, 3, i + 1) # This creates a subplot grid with 3 rows and 3 columns.
    # Inside the loop, i + 1 determines the position of each augmented image within the grid.
    plt.imshow(img_to_show) # This displays the current augmented image (img_to_show) within the subplot
    plt.axis("off") # This hides the axis labels and ticks of the subplot for a cleaner visualization

plt.tight_layout() # This adjusts the spacing between subplots to prevent overlapping.
plt.show() # This displays the final figure window containing the grid of 9 augmented images.
```

6. Creating Model-2 with Data Augmentation and Dropout to reduce Overfitting:-

```
In [57]: ## You can use Dropout layer if there is an evidence of overfitting in your findings
      ## https://www.tensorflow.org/tutorials/images/data_augmentation
## https://www.tensorflow.org/api_docs/python/tf/keras/layers/experimental/preprocessing/Random

num_classes = 9
model = Sequential([
    data_augmentation,
    layers.Rescaling(1./255),
    layers.Conv2D(16, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(32, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(64, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Dropout(0.3),
    layers.Flatten(),
    layers.Dense(128, activation='relu'),
    layers.Dropout(0.2),
    layers.Dense(num_classes)
])
```

Compiling Model-2 to reduce Overfitting :-

```
In [58]: model.compile(optimizer='adam',
                      loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits = True),
                      metrics=['accuracy'])
```

Training Model-2 to reduce Overfitting:-

```
In [59]: # Train our model-2 for 20 epochs
    epochs = 20
history = model.fit(
    train_ds,
    validation_data=val_ds,
    epochs=epochs
)
```

```

Epoch 17/20
169/169 [=====] - 20s 116ms/step - loss: 1.1290 - accuracy: 0.5497 - val_loss: 1.1471 - val_accuracy: 0.5419
Epoch 18/20
169/169 [=====] - 20s 116ms/step - loss: 1.1039 - accuracy: 0.5677 - val_loss: 1.1643 - val_accuracy: 0.5382
Epoch 19/20
169/169 [=====] - 20s 117ms/step - loss: 1.0902 - accuracy: 0.5701 - val_loss: 1.1392 - val_accuracy: 0.5598
Epoch 20/20
169/169 [=====] - 20s 117ms/step - loss: 1.0898 - accuracy: 0.5692 - val_loss: 1.1859 - val_accuracy: 0.5375
```

Visualizing the results of Training Model-2:-

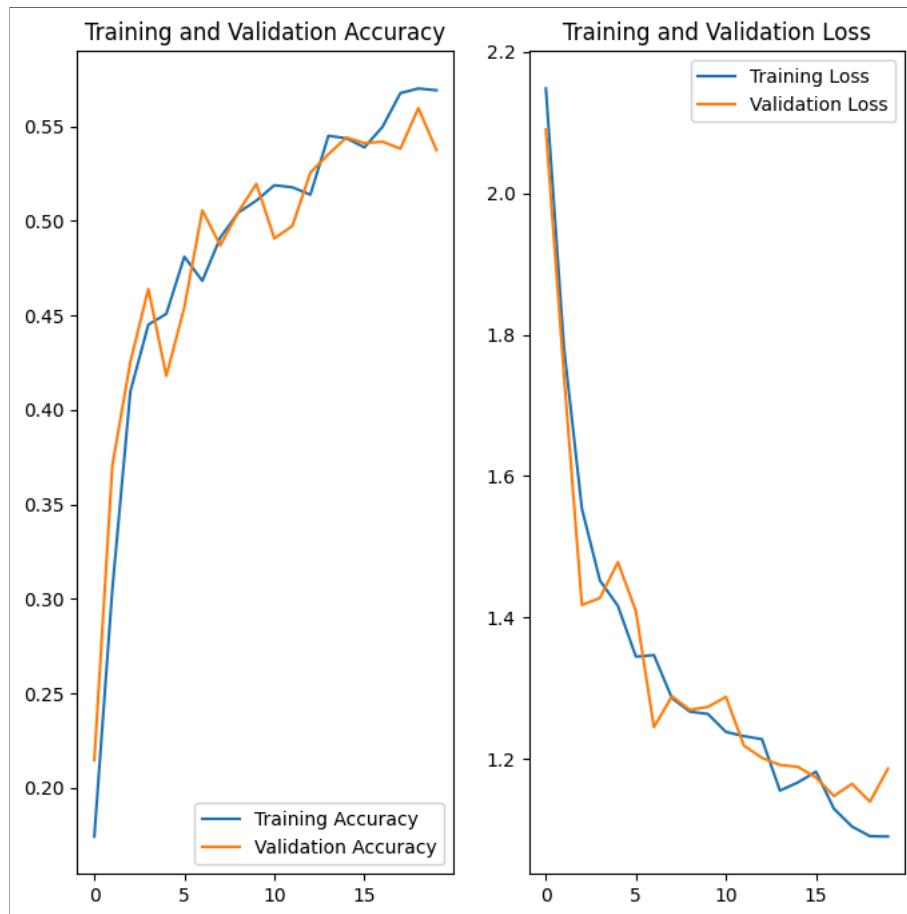

```
In [60]: acc = history.history['accuracy']
         val_acc = history.history['val_accuracy']

loss = history.history['loss']
val_loss = history.history['val_loss']

epochs_range = range(epochs)

plt.figure(figsize=(8, 8))
plt.subplot(1, 2, 1)
plt.plot(epochs_range, acc, label='Training Accuracy')
plt.plot(epochs_range, val_acc, label='Validation Accuracy')
plt.legend(loc='lower right')
plt.title('Training and Validation Accuracy')

plt.subplot(1, 2, 2)
plt.plot(epochs_range, loss, label='Training Loss')
plt.plot(epochs_range, val_loss, label='Validation Loss')
plt.legend(loc='upper right')
plt.title('Training and Validation Loss')
plt.show()
```

7. Findings after Model-2 Training:-

We'll see if there is any evidence of model overfit or underfit and if there is some improvement now as compared to the previous model run.

In the above model use of data augmentation and dropout layer reduced the problem of overfitting.

The accuracy of the model has greatly increased along with the synchronization of the validation accuracy. The loss function is synchronously exhausted for the training and validation data.

Overall, the model might be exhibiting some signs of overfitting, although not as pronounced as in the previous example.

8. Finding the distribution of classes in the training dataset:-

CONTEXT: MANY TIMES REAL LIFE DATASETS CAN HAVE CLASS IMBALANCE, ONE CLASS CAN HAVE PROPORTIONATELY HIGHER NUMBER OF SAMPLES COMPARED TO THE OTHERS. CLASS IMBALANCE CAN HAVE A DETRIMENTAL EFFECT ON THE FINAL MODEL QUALITY. HENCE AS A SANITY CHECK IT BECOMES IMPORTANT TO CHECK WHAT IS THE DISTRIBUTION OF CLASSES IN THE DATA.

```
In [61]: ## original_df -> path_list, lesion_list
path_list=[] # This Line creates an empty list named path_list to store the paths to di
lesion_list=[] # This Line creates another empty list named Lesion_List to store correspondin
```

```
In [62]: for i in class_names: # This outer Loop iterates through a List called class_names, whi
    for j in data_dir_train.glob(i+'*.jpg'): # This inner loop iterates through all .jpg
        # For example, if i is "melanoma", it would iterate through files like data_dir_train/melan
        path_list.append(str(j)) # This line appends the full path of each found image file (j) to
        lesion_list.append(i) # This line appends the corresponding class name (i) to the lesion_li
dataframe_dict_original = dict(zip(path_list, lesion_list)) # This line creates a dictionary (c
#The keys are the image paths stored in path_list. The values are the corresponding class label
original_df = pd.DataFrame(list(dataframe_dict_original.items()),columns=['Path', 'Label']) # Th
# Using the list of tuples, a Pandas DataFrame with two columns: 'Path' for the image paths and
# and the created DataFrame is assigned to the variable original_df.
original_df
```

Visualizing Class Distribution:-

```
In [64]: class_count = [] # This line creates an empty list named class_count to store the number of images in each class.

# Generate a list of random colors for each class
colors = [plt.cm.get_cmap('tab20', len(class_names))(i) for i in range(len(class_names))]

for i in class_names: # This loop iterates over the list class_names
    class_count.append(len(list(data_dir_train.glob(i+'*.jpg')))) # This line calculates the number of images in each class

plt.figure(figsize=(25, 10))

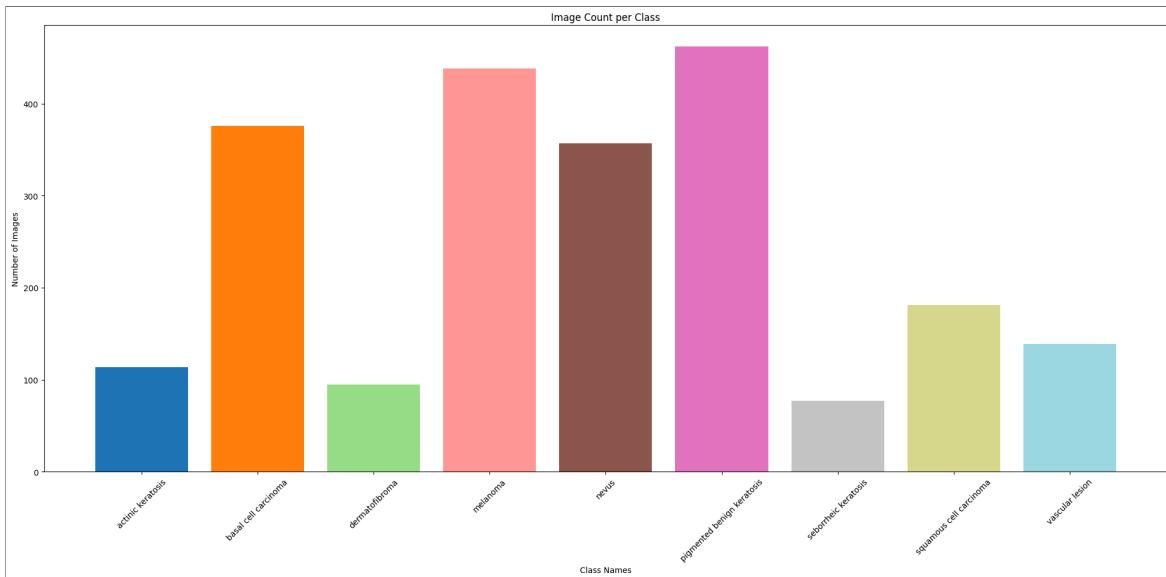

# This line creates a bar chart to visualize the class distribution.
plt.bar(class_names, class_count, color=colors)

plt.xlabel('Class Names') # Label for x-axis
plt.ylabel('Number of Images') # Label for y-axis
plt.title('Image Count per Class') # Title of the plot
plt.xticks(rotation=45) # Rotate x-axis labels for better visibility if needed
plt.show()
```

<ipython-input-64-0a31a47d096a>:4: MatplotlibDeprecationWarning: The get_cmap function was deprecated in Matplotlib 3.7 and will be removed two minor releases from now.

```
es later. Use ``matplotlib.colormaps[name]`` or ``matplotlib.colormaps.get_cma
p(obj)`` instead.
```

```
colors = [plt.cm.get_cmap('tab20', len(class_names))(i) for i in range(len(c
lass_names))]
```

9. Findings from Visualizing Class Distribution:-

- WHICH CLASS HAS THE LEAST NUMBER OF SAMPLES?

The least number of samples are in seborrheic keratosis

- WHICH CLASSES DOMINATE THE DATA IN TERMS PROPORTIONATE NUMBER OF SAMPLES?

The classes dominate in the data are:-

- pigmented benign Keratosis
- melanoma
- basal cell carcinoma
- nevus

10. Rectifying the Class Imbalance using Augmentor Package

CONTEXT: WE CAN USE A PYTHON PACKAGE KNOWN AS AUGMENTOR

(<https://augmentor.readthedocs.io/en/master/>) TO ADD MORE SAMPLES ACROSS ALL

CLASSES SO THAT NONE OF THE CLASSES HAVE VERY FEW SAMPLES.

```
In [65]: !pip install Augmentor
```

```
Collecting Augmentor

Successfully installed Augmentor-0.2.12
```

To use Augmentor, the following general procedure is followed:

1. We instantiate a Pipeline object pointing to a directory containing our initial image data set.
2. We define a number of operations to perform on this data set using our Pipeline object.
3. We execute these operations by calling the Pipeline's sample() method.

```
In [66]: path_to_training_dataset = "/content/gdrive/MyDrive/EPGP in ML and AI @ IIITB/20. DEEP
import Augmentor
for i in class_names: # This loop iterates through a list called class_names
    p = Augmentor.Pipeline(os.path.join(path_to_training_dataset, i)) # This line creates an Al
    p.rotate(probability = 0.7, max_left_rotation=10, max_right_rotation=10) # This adds a rotat
    p.sample(500) ## We are adding 500 samples per class to make sure that none of the classes

dtype: int64

So, now we have added 500 images to all the classes to maintain some class balance. We can add more images as we want to improve training process.

11. Training Model-3 on the data created using Augmentor:-

```
In [73]: batch_size = 32
        img_height = 180
        img_width = 180
```

Creating a training dataset for Model-3:-

```
In [74]: data_dir_train="/content/gdrive/MyDrive/EPGP in ML and AI @ IIITB/20. DEEP LEARNING/CNN
train_ds = tf.keras.preprocessing.image_dataset_from_directory(
            data_dir_train,
            seed=123,
            validation_split = 0.2,
            subset = 'training',
            image_size=(img_height, img_width),
            batch_size=batch_size)
```

Found 11239 files belonging to 9 classes.
Using 8992 files for training.

Creating a validation dataset for Model-3:-

```
In [75]: val_ds = tf.keras.preprocessing.image_dataset_from_directory(
            data_dir_train,
            seed=123,
            validation_split = 0.2,
            subset = 'validation',
            image_size=(img_height, img_width),
            batch_size=batch_size)
```

Found 11239 files belonging to 9 classes.
Using 2247 files for validation.

Creating Model-3 that rectifies Class Imbalance:-

```
In [76]: ## your code goes here
num_classes = 9
model = Sequential([
    data_augmentation,
    layers.Rescaling(1./255),
```

```

    layers.Conv2D(16, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(32, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Conv2D(64, 3, padding='same', activation='relu'),
    layers.MaxPooling2D(),
    layers.Dropout(0.3),
    layers.Flatten(),
    layers.Dense(128, activation='relu'),
    layers.Dropout(0.2),
    layers.Dense(num_classes)
]

```

Compiling Model-3 that rectifies Class Imbalance:-

```
In [77]: ## your code goes here
model.compile(optimizer='adam',
              loss=tf.keras.losses.SparseCategoricalCrossentropy(from_logits=True),
              metrics=['accuracy'])
```

Training Model-3 that rectifies Class Imbalance:-

```
In [78]: epochs = 30
## Your code goes here, use 50 epochs.
history30 = model.fit(
    train_ds,
    validation_data=val_ds,
    epochs=epochs
)# your model fit code
```

```

```

Visualizing Model-3 results after Training:-

```

In [79]: acc = history30.history['accuracy']
          val_acc = history30.history['val_accuracy']

          loss = history30.history['loss']
          val_loss = history30.history['val_loss']

```

```
epochs_range = range(epochs)

plt.figure(figsize=(8, 8))
plt.subplot(1, 2, 1)
plt.plot(epochs_range, acc, label='Training Accuracy')
plt.plot(epochs_range, val_acc, label='Validation Accuracy')
plt.legend(loc='lower right')
plt.title('Training and Validation Accuracy')

plt.subplot(1, 2, 2)
plt.plot(epochs_range, loss, label='Training Loss')
plt.plot(epochs_range, val_loss, label='Validation Loss')
plt.legend(loc='upper right')
plt.title('Training and Validation Loss')
plt.show()
```

12. Analyzing Results:-

The problem of overfitting and underfitting was solved and the model was well trained for predictions. Data augmentation and class equalization were found to be useful in improving model performance in this case.
